

As the focus of laboratory workflows keeps broadening to include additional insights such as methylation, and with cost pressures only increasing as of late, it's more relevant than ever to carefully pick the right combination of tools, depending on sample type, such as tissue or liquid biopsies in oncology, and your desired testing goals. With tools including target enrichment, next generation sequencing, microarrays, high-complexity pooled oligos, sample QC, and automation, Agilent's highly diversified Omics portfolio has what you need. Agilent provides you with the molecular tools to help advance your diverse research programs while maintaining cost and time efficiencies. Agilent is the source for the answers you trust!
